Preface *page* ix

1 **Webs** 1

1.1 The myth of normalcy 1
1.1.1 Knowledge, information and uncertainty 8
1.1.2 Maximum entropy 14
1.2 Empirical laws 21
1.3 Why people forecasts are usually wrong 34
1.3.1 Power laws, prediction and failure 38
1.4 Recap 41
1.5 Problems 42
References 43

2 **Webs, trees and branches** 45

2.1 Natural trees and scaling 50
2.1.1 Two kinds of scaling 52
2.1.2 Physiologic trees 59
2.2 Physiology in fractal dimensions 65
2.2.1 Fractals 66
2.2.2 Temporal scaling 74
2.2.3 Autocorrelation functions and fractal dimensions 77
2.3 Measuring what we cannot know exactly 79
2.3.1 Inverse power laws of Zipf and Pareto 80
2.3.2 Chaos, noise and probability 85
2.4 Scaling physiologic time series 88
2.4.1 Fractal heartbeats 89
2.4.2 Fractal breaths 92
2.4.3 Fractal steps 94
2.5 Some afterthoughts 98
2.6 Problems 99
References 100

3 Mostly linear dynamics 105

3.1 Hamilton's equations 107
3.2 Linear stochastic equations 114
3.2.1 Classical diffusion 118
3.2.2 Linear response theory (LRT) 124
3.2.3 Double-well potential and stochastic resonance 127
3.3 More on classical diffusion 130
3.3.1 The Fokker–Planck equation (FPE) 133
3.3.2 The drift-diffusion model (DDM) of decision making 137
3.3.3 First-passage-time distributions 142
3.4 More on statistics 144
3.4.1 Poisson statistics 145
3.4.2 Statistics with memory 147
3.4.3 Inverse power-law correlations 148
3.5 Moving from Hamiltonians to events 153
3.5.1 Age-specific failure rates 153
3.5.2 Possible forms of failure rates 155
3.5.3 Various Poisson processes 158
3.6 Overview 161
3.7 Problems 162
References 163

4 Random walks and chaos 166

4.1 Random walks 168
4.1.1 Simple random walks 169
4.1.2 Poisson webs 174
4.2 Fractal random walks 177
4.2.1 The Weierstrass walk 178
4.2.2 Lévy random flights 180
4.2.3 Fractional operator walk 183
4.3 Maps, chaos and strange attractors 188
4.3.1 The logistic equation 190
4.3.2 Strange attractors 198
4.4 Integrable and non-integrable Hamiltonians 202
4.4.1 The surface of section 205
4.4.2 Chaos and linear response theory 208
4.5 Précis 219
4.6 Problems 220
References 221

5 Non-analytic dynamics 224

5.1 Transition to fractional dynamics 225

5.1.1 Fractional calculus 228
5.1.2 Deterministic fractional dynamics 231
5.2 Some applications 234
5.2.1 The fractional Poisson distribution 234
5.2.2 The Weibull distribution 236
5.3 Fractional stochastic equations 237
5.3.1 The fractional Langevin equation 237
5.3.2 Multiplicative random force 239
5.3.3 Some physiologic multifractals 242
5.4 Spatial heterogeneity 247
5.4.1 Random fields 247
5.4.2 Continuous-time random walks (CTRWs) 250
5.4.3 Infinite moments 254
5.4.4 Scaling solutions 257
5.5 Reiteration 258
5.6 Problems 259
References 259

6 A brief recent history of webs 262

6.1 Web growth 264
6.1.1 Scale-free webs 265
6.1.2 Communication webs 268
6.2 Graphic properties of webs 275
6.2.1 Random webs 277
6.2.2 Real webs 286
6.2.3 Web failures 294
6.3 Deterministic web models 297
6.3.1 Hierarchal webs 297
6.3.2 From small to ultra-small networks 301
6.4 Reflections 303
6.5 Problems 304
References 305

7 Dynamics of chance 307

7.1 The master equation 308
7.1.1 Discrete dynamics 309
7.1.2 A synchronized web of two-level nodes 310
7.1.3 Stochastic approximation to a synchronized web 314
7.1.4 The Yule process 317
7.2 General modeling strategy 319
7.2.1 From crucial events to the GME 319
7.2.2 Relaxation of the two-level GME 322
7.2.3 Perturbing the GME 323

7.2.4 Towards a new LRT 326
7.2.5 Stochastic resonance and conventional LRT 327
7.3 The Universality of LRT 331
7.3.1 The Hamiltonian approach to LRT 332
7.3.2 Applying the formalism 334
7.3.3 The experimental approach 336
7.3.4 Theoretical interpretation 340
7.4 The statistical habituation model (SHM) 344
7.4.1 Simple stimulus and renewal theory 346
7.4.2 Information resonance and dishabituation 348
7.4.3 Discussion 349
7.5 Summary 351
7.6 Problems 352
References 353

8 Synopsis 357
